

# 14<sup>th</sup> Annual Harvard-MIT Mathematics Tournament

## Saturday 12 February 2011

1. Let  $ABC$  be a triangle such that  $AB = 7$ , and let the angle bisector of  $\angle BAC$  intersect line  $BC$  at  $D$ . If there exist points  $E$  and  $F$  on sides  $AC$  and  $BC$ , respectively, such that lines  $AD$  and  $EF$  are parallel and divide triangle  $ABC$  into three parts of equal area, determine the number of possible integral values for  $BC$ .
2. Let  $a$ ,  $b$ , and  $c$  be positive real numbers. Determine the largest total number of real roots that the following three polynomials may have among them:  $ax^2 + bx + c$ ,  $bx^2 + cx + a$ , and  $cx^2 + ax + b$ .
3. Let  $f : \mathbb{R} \rightarrow \mathbb{R}$  be a differentiable function such that  $f(0) = 0$ ,  $f(1) = 1$ , and  $|f'(x)| \leq 2$  for all real numbers  $x$ . If  $a$  and  $b$  are real numbers such that the set of possible values of  $\int_0^1 f(x) dx$  is the open interval  $(a, b)$ , determine  $b - a$ .
4. Josh takes a walk on a rectangular grid of  $n$  rows and 3 columns, starting from the bottom left corner. At each step, he can either move one square to the right or simultaneously move one square to the left and one square up. In how many ways can he reach the center square of the topmost row?
5. Let  $H$  be a regular hexagon of side length  $x$ . Call a hexagon in the same plane a “distortion” of  $H$  if and only if it can be obtained from  $H$  by translating each vertex of  $H$  by a distance strictly less than 1. Determine the smallest value of  $x$  for which every distortion of  $H$  is necessarily convex.
6. Nathaniel and Obediah play a game in which they take turns rolling a fair six-sided die and keep a running tally of the sum of the results of all rolls made. A player wins if, after he rolls, the number on the running tally is a multiple of 7. Play continues until either player wins, or else indefinitely. If Nathaniel goes first, determine the probability that he ends up winning.
7. Let  $ABCDEF$  be a regular hexagon of area 1. Let  $M$  be the midpoint of  $DE$ . Let  $X$  be the intersection of  $AC$  and  $BM$ , let  $Y$  be the intersection of  $BF$  and  $AM$ , and let  $Z$  be the intersection of  $AC$  and  $BF$ . If  $[P]$  denotes the area of polygon  $P$  for any polygon  $P$  in the plane, evaluate  $[BXC] + [AYF] + [ABZ] - [MXZY]$ .
8. Let  $f : [0, 1) \rightarrow \mathbb{R}$  be a function that satisfies the following condition: if

$$x = \sum_{n=1}^{\infty} \frac{a_n}{10^n} = .a_1a_2a_3\dots$$

is the decimal expansion of  $x$  and there does not exist a positive integer  $k$  such that  $a_n = 9$  for all  $n \geq k$ , then

$$f(x) = \sum_{n=1}^{\infty} \frac{a_n}{10^{2n}}.$$

Determine  $f'(\frac{1}{3})$ .

9. Let  $ABCD$  be a square of side length 13. Let  $E$  and  $F$  be points on rays  $AB$  and  $AD$ , respectively, so that the area of square  $ABCD$  equals the area of triangle  $AEF$ . If  $EF$  intersects  $BC$  at  $X$  and  $BX = 6$ , determine  $DF$ .
10. Evaluate  $\int_1^{\infty} \left(\frac{\ln x}{x}\right)^{2011} dx$ .
11. Let  $ABCDEF$  be a convex equilateral hexagon such that lines  $BC$ ,  $AD$ , and  $EF$  are parallel. Let  $H$  be the orthocenter of triangle  $ABD$ . If the smallest interior angle of the hexagon is 4 degrees, determine the smallest angle of the triangle  $HAD$  in degrees.

12. Sarah and Hagar play a game of darts. Let  $O_0$  be a circle of radius 1. On the  $n$ th turn, the player whose turn it is throws a dart and hits a point  $p_n$  randomly selected from the points of  $O_{n-1}$ . The player then draws the largest circle that is centered at  $p_n$  and contained in  $O_{n-1}$ , and calls this circle  $O_n$ . The player then colors every point that is inside  $O_{n-1}$  but not inside  $O_n$  her color. Sarah goes first, and the two players alternate turns. Play continues indefinitely. If Sarah's color is red, and Hagar's color is blue, what is the expected value of the area of the set of points colored red?
13. Let  $ABCD$  be a cyclic quadrilateral, and suppose that  $BC = CD = 2$ . Let  $I$  be the incenter of triangle  $ABD$ . If  $AI = 2$  as well, find the minimum value of the length of diagonal  $BD$ .
14. Let  $f : [0, 1] \rightarrow [0, 1]$  be a continuous function such that  $f(f(x)) = 1$  for all  $x \in [0, 1]$ . Determine the set of possible values of  $\int_0^1 f(x) dx$ .
15. Let  $f(x) = x^2 - r_2x + r_3$  for all real numbers  $x$ , where  $r_2$  and  $r_3$  are some real numbers. Define a sequence  $\{g_n\}$  for all nonnegative integers  $n$  by  $g_0 = 0$  and  $g_{n+1} = f(g_n)$ . Assume that  $\{g_n\}$  satisfies the following three conditions: (i)  $g_{2i} < g_{2i+1}$  and  $g_{2i+1} > g_{2i+2}$  for all  $0 \leq i \leq 2011$ ; (ii) there exists a positive integer  $j$  such that  $g_{i+1} > g_i$  for all  $i > j$ , and (iii)  $\{g_n\}$  is unbounded. If  $A$  is the greatest number such that  $A \leq |r_2|$  for any function  $f$  satisfying these properties, find  $A$ .
16. Let  $ABCD$  be a quadrilateral inscribed in the unit circle such that  $\angle BAD$  is 30 degrees. Let  $m$  denote the minimum value of  $CP + PQ + CQ$ , where  $P$  and  $Q$  may be any points lying along rays  $AB$  and  $AD$ , respectively. Determine the maximum value of  $m$ .
17. Let  $f : (0, 1) \rightarrow (0, 1)$  be a differentiable function with a continuous derivative such that for every positive integer  $n$  and odd positive integer  $a < 2^n$ , there exists an odd positive integer  $b < 2^n$  such that  $f(\frac{a}{2^n}) = \frac{b}{2^n}$ . Determine the set of possible values of  $f'(\frac{1}{2})$ .
18. Collinear points  $A$ ,  $B$ , and  $C$  are given in the Cartesian plane such that  $A = (a, 0)$  lies along the  $x$ -axis,  $B$  lies along the line  $y = x$ ,  $C$  lies along the line  $y = 2x$ , and  $AB/BC = 2$ . If  $D = (a, a)$ , the circumcircle of triangle  $ADC$  intersects  $y = x$  again at  $E$ , and ray  $AE$  intersects  $y = 2x$  at  $F$ , evaluate  $AE/EF$ .
19. Let

$$F(x) = \frac{1}{(2 - x - x^5)^{2011}},$$

and note that  $F$  may be expanded as a power series so that  $F(x) = \sum_{n=0}^{\infty} a_n x^n$ . Find an ordered pair of positive real numbers  $(c, d)$  such that  $\lim_{n \rightarrow \infty} \frac{a_n}{n^d} = c$ .

20. Let  $\omega_1$  and  $\omega_2$  be two circles that intersect at points  $A$  and  $B$ . Let line  $l$  be tangent to  $\omega_1$  at  $P$  and to  $\omega_2$  at  $Q$  so that  $A$  is closer to  $PQ$  than  $B$ . Let points  $R$  and  $S$  lie along rays  $PA$  and  $QA$ , respectively, so that  $PQ = AR = AS$  and  $R$  and  $S$  are on opposite sides of  $A$  as  $P$  and  $Q$ . Let  $O$  be the circumcenter of triangle  $ASR$ , and let  $C$  and  $D$  be the midpoints of major arcs  $AP$  and  $AQ$ , respectively. If  $\angle APQ$  is 45 degrees and  $\angle AQP$  is 30 degrees, determine  $\angle COD$  in degrees.
